

Set up Talyx in Microsoft 365 Copilot Agent Builder

Start here. Follow these steps in order.

This guide is for Microsoft 365 Copilot in a work tenant.
License, feature access, and sharing depend on your organization.

1 Create an agent

In Microsoft 365 Copilot, choose Agents, then New agent.
Choose Skip to configure.

2 Add Talyx instructions

Open m365-copilot-agent-builder-instructions.md.
Copy only the text block under Agent instructions; paste it into Instructions.

3 Add company context

Under Configure > Knowledge > Upload, add talyx-company-setup.txt.
This supplied text file carries the current setup and parameter reference.

4 Create and open the agent

Select Create, then open the saved agent.

5 Set up Talyx and reuse its file

In the agent, say “Set up Talyx” and answer the short questions.
Save the updated talyx-company-setup.txt and upload it under Knowledge for reuse.

Need help?

This is Agent Builder for Microsoft 365 work tenants, not consumer Copilot or GitHub Copilot. “Only use specified sources” does not block general AI knowledge.
